Charger <Char...@thamcw.8m.com wrote in message | 1)integrated stuff, u wont get the choice u want if kaput how?cant upgrade also | 2)integ... VGA use up system ram..... last time i tried 4mb system ram is much slower than using independant 1mb cheapo vga card my advise?=dun use built in business?then why u need the sound card?

hi please explain in detail..why a built in motherboard with vgs and sound or others is not a good choice???? its good i would think. for work based. no games. but when it comes to linux, linux won't recognise the vga and sound card. of course, certain vga like the sis5597/5598 can be recognised by linux, and run's fairly well. (no complaints). but the newer sis agp cards that come with bxpro boards are not ok with linux. we sent people back with 320x200 resolutions! is it a good choice for business?..no games! windows only. my conclusion: good for windows. ok for linux, but video is an important thing. get a new video card? argh! sound is important too..

Khoo Beng Kai <net...@pd.jaring.my wrote in message | ASUS SP97V's vga is using shared memory hence the  
slowdown in performance. | This is the problem with majority of mobo nowadays where the manufacturer | resorts to  
stealing RAM from your system memory. | | On the other hand, if you could get hold of the old batch of PC100 |  
Supersocket 7 TXPro mobo you would not have the problem. It comes with full | 8Mb RAM on board. Or try out Intel's  
SR440BX with 16Mb nVidia TNT and | Creative PCI 64 integrated on the motherboard. oic was not aware of such  
thing,thought all built in vga is using system memory any newer model still work the pc100 way? the sr440bx cost a  
bomb :(

using SIS AGP card (forgot model name) with onboard 8MB.... SiS 6326. They have a PowerDVD version specifically  
for this chipset. But certainly, anything short of a hardware based DVD decoder would make it run smoothly on a K6-2  
machine. ...jason
